

# Forces and Friction

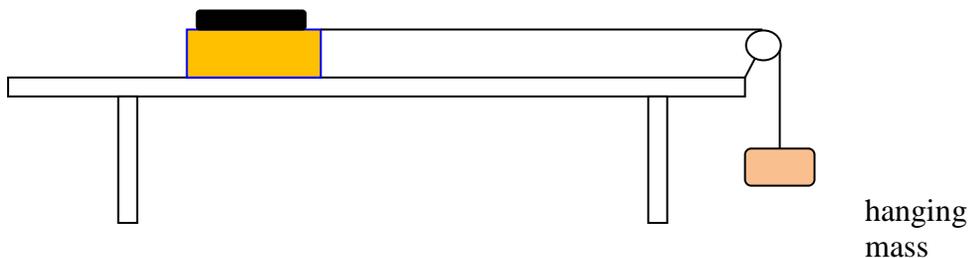

*Purpose:* To determine the friction between two surfaces and then find the acceleration and forces associated with various systems.

*Procedure:*

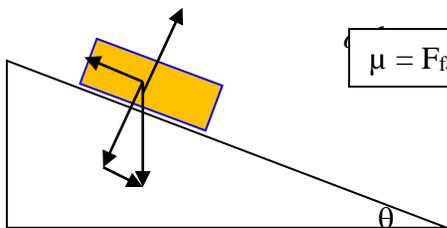

- 1) Find  $\mu$  by setting up the ramp on the horizontal and adding enough hanging mass to get the block to move at a constant velocity;  $\Sigma F = 0$   $F_h$  refers to “weight of hanging mass”

- 2) Add mass to the block (object-black rectangular block) and see how much hanging mass is needed to move the block at  $v_c$ . Does this change  $\mu$ ?

- 3) Remove the mass (from object) and verify  $\mu$  by placing the ramp at the inverse tangent of  $\mu$  and seeing if the block slides down at  $v_c$ . When the block slides down at a *constant velocity* then  $F_f = -F_p$  ( $\Sigma F = 0$ ). And in the equation “ $\mu = F_f / F_N$ ”,  $F_f$  can be replaced with  $F_p$  ( $F_p = -F_f$ ), so the equation becomes “ $\mu = F_p / F_N$ ”, solving for  $F_p = \sin\theta F_w$  and  $F_N = \cos\theta F_w$ . Note that the  $F_w$ 's cancel and  $\mu = \sin\theta / \cos\theta = \tan\theta$ . Therefore, the block slides down the ramp at  $v_c$  when “ $\mu = \tan\theta$ ”

$$\mu = F_f / F_N = F_p / F_N = \sin\theta F_w / \cos\theta F_w = \sin\theta / \cos\theta = \tan\theta$$

- 4) A) Adjust the ramp to a higher angle (about  $10^\circ$  than #3) and determine the angle. Using 2<sup>nd</sup> Law and the parallel and perpendicular forces calculate the forces acting and the acceleration the block (without additional mass).

*Show all calculations!*

Data table of above steps:

1) mass hanging;  $m_h = \underline{\hspace{2cm}} \text{ g}; \underline{\hspace{2cm}} \text{ kg}; F_{11} = \underline{\hspace{2cm}} \text{ N}, F_f = \underline{\hspace{2cm}} \text{ N}$   
mass of block;  $m_b = \underline{\hspace{2cm}} \text{ g}; \underline{\hspace{2cm}} \text{ kg}; F_w = \underline{\hspace{2cm}} \text{ N}; F_N = \underline{\hspace{2cm}} \text{ N}$   
 $\mu =$

2) mass hanging;  $m_h = \underline{\hspace{2cm}} \text{ g}; \underline{\hspace{2cm}} \text{ kg}; F_{11} = \underline{\hspace{2cm}} \text{ N}, F_f = \underline{\hspace{2cm}} \text{ N}$   
mass of block;  $m_b = \underline{\hspace{2cm}} \text{ g}; \underline{\hspace{2cm}} \text{ kg}; F_w = \underline{\hspace{2cm}} \text{ N}; F_N = \underline{\hspace{2cm}} \text{ N}$   
 $\mu =$

3)  $\theta = \underline{\hspace{2cm}}^\circ, \mu = \tan\theta; \tan \underline{\hspace{2cm}}^\circ = \underline{\hspace{2cm}}$   
Does the object slide down at  $v_c$ ? ...explain! In not, what did you have to do to get it too? ... explain!

4.  $h = \underline{\hspace{2cm}} \text{ m}; \text{ hyp} = \underline{\hspace{2cm}} \text{ m}; \sin\theta = h/\text{hyp}; \theta = \underline{\hspace{2cm}}^\circ$   
 $F_p = \underline{\hspace{2cm}} \text{ N} \quad F_N' = \underline{\hspace{2cm}} \text{ N} \quad F_f = \underline{\hspace{2cm}} \text{ N} \quad a = \underline{\hspace{2cm}} \text{ m/s}^2$
